

following components.

- **Indigo Agent:** This represents the core libraries and includes a HAL abstraction layer to facilitate easy integration with regard to forwarding and the port management interfaces of physical or virtual switches. It includes a configuration abstraction layer to support running OpenFlow in a hybrid mode.

▪ **LoxiGen:** This is a compiler that generates OpenFlow marshalling/un-marshalling in multiple languages. The architecture of Indigo is divided into the platform-independent and platform-specific categories. The platform-independent modules are Socket Manager, OpenFlow Connection Manager and OpenFlow State Manager. The configuration platform-specific modules are the Forwarding and Port Manager.

Features

- Pure OpenFlow 1.0 implementation.
- Creates flexibility in how the network is used and operated as well as for data analytics.
- Easy integration with computing for research management and maintenance.
- Lowers operating expenses, resulting in fewer errors and less

network downtime via automated network configuration.
