

```
import org.openqa.selenium.winium.DesktopOptions;
import org.openqa.selenium.winium.WiniumDriver;

public class MyFirstTestCase {

    public static void main(String[] args) throws
        MalformedURLException, InterruptedException {

        DesktopOptions option = new DesktopOptions();

        option.setApplicationPath("C:\\Windows\\System32\\
        calc.exe");

        WiniumDriver driver = new WiniumDriver(new
        URL("http://localhost:9999"), option);
        Thread.sleep(5000);
        driver.findElement(By.name("Seven")).click();
        driver.findElement(By.name("Plus")).click();
        driver.findElement(By.name("Eight")).click();
        driver.findElement(By.name("Equals")).click();
        Thread.sleep(5000);

        String output = driver.findElement(By.
        id("CalculatorResults")).getAttribute("Name");
```

```
        System.out.println("Result after addition is:
        "+output);

        driver.quit();

    }
}
```

When to use Winium

Use Winium once you are familiar with Selenium and are in search of a tool to automate the Windows desktop application. Winium fits the bill as you are already aware of most of the functionality in Selenium. There are a few bugs in Winium right now and it is still undergoing a maturing process, just like Selenium once did.
