

Figure 1: Virtual machine home

Figure 2: Creating a virtual machine

of time, it means that virtualisation technology is not enabled for you and you need to enable it:

- VT-x/AMD-V hardware acceleration is not available on your system
- This host supports Intel VT-x, but Intel VT-x is disabled
- The processor on this computer is not compatible with Hyper-V

If you have not installed Virtual Box, then you can go to the links <https://www.virtualbox.org/wiki/Downloads> and <http://download.virtualbox.org/virtualbox/5.1.28/VirtualBox-5.1.28-117968-Win.exe>, and download and install it. The steps are very straightforward; hence, I am not mentioning them here.

Open the Virtual Box application once it is installed. It will look like what's shown in the snapshot in Figure 1.

Click on the **New** button and select the OS category before providing the appropriate name to the virtual machine.

Assign RAM as per your requirements. Ubuntu can run on 512MB, which is the minimum requirement to run Linux smoothly on Windows. Since I have 8GB RAM in my laptop, I have chosen 2048MB (2GB) RAM.

Figure 3: Assigning RAM

Figure 4: Select virtual hard disk

Figure 5: Select virtual hard disk type

The next option is to select the virtual hard disk. Since we are creating a new virtual machine, we will use the 'Create virtual hard disk now' option.

Here we need to select the virtual hard disk type. Since
