

Figure 6: Disk space

Figure 7: Selecting the ISO file

we are using Virtual Box, we will use VDI which is a Virtual Box disk image.

There are two options here — we can either use a fixed size or a dynamic size. It is better to opt for the latter so that the size can be increased if required.

Allocate the disk space as per your requirement.

Once it is done, go to the virtual machine that you have created, right-click on it and go to the settings of that machine. Now we must attach the location of the Ubuntu ISO file. As shown in the snapshot (Figure 7), click on the **DISK** button and browse the **.ISO** file of Ubuntu OS. The ISO file is now attached.

Next, go to the virtual machine, right-click on it and start it.

You will get the Ubuntu installation screen, which is similar to installing any operating system that you have chosen. The remaining steps are similar to the installation of any OS.

If you want to close the virtual machine window, you can do one of three things.

1. **Save the machine:** This is like hibernate. The system will resume from wherever you left off, the next time when you start — it will show you the same task at which you paused.

Figure 8: Installation started

Figure 9: Install Ubuntu like any normal OS

2. **Send the 'Shutdown' signal:** This is like pressing the power button. It will allow normal shutdown of the virtual machine.
3. **Power off the machine:** This is like pulling a power cable. It is for a hard shutdown which is required in scenarios where a VM gets hung or is not working properly.

At any time, if you want to destroy the virtual machine you created, right-click and select the **Remove** option. This will remove all the related files.

In this article, we have seen the basic operations of a virtual machine. We can explore other options in a subsequent one.
