

Indian e-commerce startup **Fynd** contributes back to the open source community

Mumbai-based online fashion store, **Fynd**, has launched **GoFynd.io** as a dedicated platform to support the open source community. The platform includes solutions such as **Fynd API**, **Fyx** and **Metricbeat**, which were originally designed for internal operations.

Harsh Shah, co-founder, **GoFynd.io**

Deploying open source is relatively easier for a company than contributing back to the community by releasing the source code for solutions developed to address specific internal requirements. But **Fynd** has found a way to support the growth of open source by launching **GoFynd.io**. The online store, which targets the youth with branded products across categories such as clothing, footwear, jewellery and accessories, has been primarily built using developer-friendly technologies, including **Angular**, **Ansible**, **Apache Kafka** and **React**. These technologies work with native tools and data stream options such as the **Fynd Open API**,

Witi, **Fyx**, **Ansible Metricbeat** and **Gravity**, which are available through the **GoFynd.io** platform.

"Indian startups are often a step behind when it comes to open source policy. We wanted to break this pattern and do our bit by openly sharing our own internal developments," says **Fynd** co-founder **Harsh Shah**.

There are a total of 30 developers at **Fynd**, with 20 working primarily on **GoFynd.io**. These developers are also making things easier for early adopters

by posting new blog posts on a regular basis.

Promotion of in-house developments

Fynd is using online forums to make people aware of its open source work. Additionally, the company has invited the developer community to not only use its resources, but also give its feedback and further build on the existing projects.

"By open sourcing, **Fynd** aims to make its engineering tools and data streams visible to the whole world, including companies opting for open source solutions as well as
