

Analyse Big Data With Apache Storm

Open source software has an array of tools that deal with high speed Big Data, of which Apache Storm is very popular. This article discusses various aspects of Apache Storm.

Big Data analytics is one of the key areas of research today, and uses assorted approaches in data science and predictive analysis. There are a number of scenarios in which enormous amounts of data are logged every day and need deep evaluation for research and development. In medical science, there are numerous examples where processing, analysis and predictions from huge amounts of data are required regularly. As per reports from First Post, data of more than 50 petabytes is generated from each hospital of 500 beds in the USA. In another research study, it was found that one gram of DNA is equivalent to 215 petabytes in digital data. In another scenario of digital communication, the number of smart wearable gadgets has increased from 26 million in 2014 to more than 100 million in 2016.

The key question revolves around the evaluation of huge amounts of data growing at great speed. To preprocess, analyse, evaluate and make predictions on such Big Data based applications, we need high

performance computing (HPC) frameworks and libraries, so that the processing power of computers can be used with maximum throughput and performance.

There are many free and open source Big Data processing tools that can be used. A few examples of such frameworks are Apache Storm, Apache Hadoop, Lumify, HPCC Systems, Apache Samoa and ElasticSearch.

MapReduce technology

Of the above-mentioned tools, Apache Storm is one of the most powerful and performance-oriented real-time distributed computation systems under the free and open source software (FOSS) paradigm. Unbound and free flowing data from multiple channels can be effectively logged and evaluated using Apache Storm with real-time processing, compared to batch processing in Hadoop. In addition, Storm has been effectively adopted by numerous organisations for corporate applications with the integration of some programming language, without any issues of compatibility. The state of
