

to <https://portal.azure.com/>. To get some quick hands-on experience on creating an application, follow the steps given below.

Log in with valid credentials and you will get the Azure dashboard.

First, let's create an App Service Plan (ASP) so that we can host Azure App Services on it. Click on ASP in the left sidebar, and then click on +Add.

Give the name of the ASP, then the name of the New Resource Group, the operating system, the location where ASP must be hosted, and the most important part — the pricing tier. Next, click on Create.

Once we have ASP ready, click on App Services in the left sidebar and then on +Add.

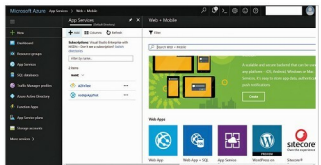

Figure 6: Application settings of the Azure App Service (Azure Web apps) in the Microsoft Azure dashboard default, it is a .NET app. Let's look at how to change it to a Java application.

Select the Java version as Java 8. Select the Java Minor version and Web Container too.

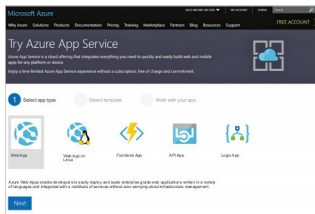

Figure 3: Azure Web App in Microsoft Azure

Select Web App. Click on Create. Give the App Name, and select the Resource Group that we have created while creating the ASP. Click on Create.

Wait for some time, and once the Azure Web App is ready, you can access it from the Azure dashboard.

Verify the Resource Group, the status of the Web App (its location and URL), the App Service Plan, FTP details and monitoring related details.

Visit the URL in the browser.

Go to the Azure Web App just created and click on Application Settings. When we create an Azure Web app, by
