

To keep a 64-bit platform for the application, we need to change the pricing plan to *Standard*.

Put the *Always On* switch on, and click on *Save*.

Visit the URL of the *Azure Web App* and verify the change in the *Java* application.

Figure 8: Java based *Azure Web App*

Go to *Properties*, check the status, the virtual IP address, the outbound IP address, and *FTP* related details.

Figure 9: Properties of *Azure App Services*

For checking logs, and to know more about the structure, go to the *Kudu* editor using the URL <https://osfjtestapp.scm.azurewebsites.net>. Add *SCM* in the original URL.

Verify the *Web Apps* directory.

There are two types of scaling – vertical and horizontal.

When scaling up, we can perform vertical scaling. Actually, this is a scaling up of the *App Service Plan*.

Figure 11: Scaling up the *App Service Plan*

In the *Basic* pricing tier, horizontal scaling is not supported, but it is supported in the *Standard* pricing tier.

Logging is an important aspect in case of troubleshooting and, by default, logging is not enabled.

Figure 13: Log configuration of *Azure App Services* in Microsoft *Azure*

All log files can be accessed from the *Azure* portal as well as the *Kudu* editor.

In this article, we have created a *Web* application using Microsoft *Azure App Services*, which is a *PaaS* offering from Microsoft. The road ahead can be continuous integration and delivery using *Visual Studio Team Services* to implement *DevOps* practices.
