

# Yarn: A Quick, Reliable and Safe Way to Share Code

Yarn is a collaboration between Facebook, Exponent, Google and Tilde. It is a package manager which aims at more reliable and secure installs. It manages dependencies consistently across machines and also in a secure offline environment.

Earlier, developers typically looked for the package (JS, CSS) on the Internet, downloaded the zipped version, extracted it and linked it to the Web page. But the first four steps were very time consuming. The more dependencies that were required, the more time developers had to invest in repeating the same steps. Moreover, all these dependencies had to upload in a version control system, so that other developers could reuse the same dependencies in their projects.

To solve the problem of managing dependencies, Bower entered the JavaScript world. This helped developers to manage dependencies and share code, through the central registry, with other developers from around the world. But Bower had some shortcomings which were resolved by npm, which is the default package manager for Node.js. npm is good but it also has some shortcomings that have now been resolved by Yarn.

## Yarn

Yarn is a package manager for your code. It allows you to use and share code with other developers from around the world through a central registry and in other ways. Yarn does this quickly, securely, and reliably so you don't ever have to worry. Yarn is fast, reliable and offers secure dependency management.

Code is shared through something called a *package/module*. A package contains all the code being shared as well as a *package.json* file, which describes the package and dependencies.

Shown below is a sample format of *package.json*:

```
{
  "name": "yarnitest",
  "version": "1.0.0",
```
