

naturally resistant to change. Thus, it is a slow process to get organisations to adopt open source for a business-critical system, and security issues are only one factor causing the delay.

Q How can open source adoption help companies improve their profitability?

Many studies have shown that the total cost of ownership (TCO) for open source software is much lower than that of proprietary software. But as companies move more and more of their computing to the cloud, the TCO difference is reduced, so the financial impact of adopting open source is less than it once was. Increased profitability is a minor, but valuable, reason for choosing open source software.

Q Do you see federal-level adoption having a positive effect on overall open source deployments?

Yes. Success stories in the use of any open source product (not just software)

encourage people to see if they might benefit from following the same idea. In some countries, notably Brazil, the government not only uses open source software but has also developed a body of 'public software' that can be used by others, and requires its suppliers to deliver their solutions as open source software. The US government has

“
The software landscape has seen a mix of proprietary and open source software throughout this century.
”

increased its open source efforts across most federal departments and makes some of its open source code available through code.gov. Efforts such as these show that open source software projects can be successful and deliver value to the community.

Q Lastly, what is the role of organisations like Open Source Initiative and Linux Foundation in taking open source to new heights?

The Linux Foundation has greatly improved its outreach and now serves as the umbrella organisation for a large number of open source projects. Beyond that, it has organised the Open Source Summit in the US and Europe, both of which draw large audiences that include many people with very little open source experience. The Open Source Initiative (OSI) continues to focus on licence approvals, but has also established individual and affiliate membership programmes aimed at building its own community. However, the OSI is relatively small and works primarily within the existing open source community, so it does not have the overall impact of some other organisations. The OSI and the Linux Foundation have the strongest influence in North America and must be complemented by similar organisations elsewhere around the world. Such groups, taken together, can help to promote the value of open source software.
