us beyond that. Its controls can be a little difficult to work with. For instance, it assumes that different people will draw the new shapes by starting from the top-left corner and then moving down, before moving to the right. (We get some odd results if we try drawing objects going from right to left.)

Dia is easy to use, and comes with a slew of common object categories such as hydraulic, electrical, programming, and so on. With Dia, it is really easy to jump-start a drawing of any sort.

Advantages of open source productivity tools

1. **Available free of cost:** First of all, as soon as we add an open source tag to any tool, it certifies that the tool is available free of cost.

Figure 3: Advantages of open source productivity tools (Image source: googleimages.com)

2. **Versatile and flexible:** People choose open source productivity tools because they have more freedom over such tools. They can analyse the code in order to be sure that it does not do anything they don't want it to, and can also change it if they want to do so. Even a non-programmer can use these tools by modifying them to specific needs.
3. **Documentation and help available:** All open source productivity tools have documentation available online, which really helps to use them easily. Since the documentation is publicly available, users can study it to improve and make finer software. They can also share their code with the others, hence evolving their skills.
4. **Highly stable:** People usually choose open source productivity tools rather than the licensed versions for some essential and long-term projects. As we know, programmers publicly distribute the code for different

Tips to make a Windows system more productive

1. Install the latest network adapter firmware, storage area network drivers, and network adapter drivers.
2. Disable all hyper-threading present on BizTalk Server and SQL Server computers.
3. Configure the antivirus software to avoid real-time scanning of BizTalk Server executables and file drops.
4. Review the disk controller stripe's size and volume allocation units.
5. Optimise Windows Server's performance for background services.
6. Disable non-essential services like Messenger, Clipbook, Telephony, etc.
7. Disable intrusion detection network scanning between the computers in the BizTalk Server environment.
8. Defragment all disks present in the BizTalk Server environment on a regular basis.
9. Disable real-time scanning of the data and transaction files if antivirus software is installed on the SQL Server computer.
10. Configure firewall(s) for BizTalk Server.
11. Use the Interrupt Filter Configuration tool to bind network adapter interrupts to specific processors present on multi-processor computers.
12. Use the NTFS file system on all volumes. Do not use NTFS file compression.
13. Assign the MSDTC log file directory to a separate dedicated drive.
14. Monitor drive space utilisation.
15. Implement a strategy to avoid disk fragmentation.
