

fields are completed. For those businesses requiring additional customisation, a new API allows developers to create customised field types and rules before deploying them in Liferay.

Teams save time and have the flexibility to create the pages they want by storing page sections as fragments and reusing them anywhere within their Liferay site. More technical users can use the new Fragment Editor, a professional code editor located within the browser, to create or edit fragments.

Development teams may also create fragments using their preferred tools and import them into Liferay. The new Page Editor allows business users to visually lay out page designs, save them as reusable templates and add unstructured content, as needed.

Alibaba Cloud launches new distribution strategy at its New Delhi Summit

Cloud computing being a lucrative market, tech giants like Alibaba are trying to capture most of it.

Alibaba Cloud, the cloud computing arm of the Alibaba Group, launched its new distribution channel programme at the India Eco Summit held recently in Delhi. The programme aims to build an open ecosystem among sales, technology and service partners. Under this channel strategy, Alibaba Cloud will also build specialised teams to focus on various market segments and sectors such as startups and online businesses.

India currently ranks third on the list of countries in the APeJ (Asia Pacific excluding Japan) with US\$ 2.12 billion spent on public cloud services. Alibaba Cloud provides products and services to clients in India across the e-commerce, gaming, media, retail and IoT sectors through an extensive network of distributors.

The new channel strategy will further strengthen Alibaba Cloud's commitment to the Indian market.

"Alibaba Cloud has always been dedicated to empower enterprises of different sizes to tap into opportunities

in the digital age. With digital transformation poised to add close to US\$ 154 billion to India's GDP, this is a great opportunity for us to do business in India. We are excited about the launch of the distribution channel programme, as building a strong, collaborative partner ecosystem is essential to our growth strategy in India. Through working with different partners, we will be able to bring our high quality products and services to customers in India to help them embrace the opportunities of digital transformation," said Alex Li, GM of Alibaba, Asia Pacific.

Alibaba Cloud also announced that it will train 1,000 sales and technology personnel in India in the next six months.

In January this year, Alibaba Cloud set up its first India data centre in Mumbai to address the surging demand for cloud computing services among Indian SMEs.

Alibaba Cloud now has 47 availability zones across 18 economic centres globally, with coverage extending across mainland China, Hong Kong, Singapore, Japan, Australia, the Middle East, Europe, India and the US (East and West Coasts).

The Alibaba Cloud Eco Summit is hosted in four regions throughout the year. The first stop this year was the Hong Kong Summit held on March 7,

followed by the EMEA Summit held in Paris on July 2.

Dirt Protocol uses blockchain based approach to vet information

The team at Dirt Protocol is using blockchain technology to create a new approach to verify information and contribute more to this technology.

The startup doesn't plan to launch its platform until later this year, but it announced that it has raised US\$ 3 million in seed funding from various firms. Dirt Protocol isn't trying to create a single, definitive data repository, but rather to provide the tools for developers to build their own databases.

The founder of the company previously created the lockscreen startup Echo (which was later acquired by Microsoft) and the laundry startup, Prim. A company official stated that after becoming interested in the cryptocurrency industry, the firm's founder was concerned about the fear, uncertainty and doubt around coin offerings.

The market today is still unregulated, with high incentives for people to spread misinformation for personal gain. So the founder's solution to this was to build databases where anyone can contribute information, but where they have skin in the game so there's a financial penalty if they're not truthful.

Dirt Protocol isn't trying to create a single, definitive data repository, but rather to provide the tools for developers to build their own databases. Those databases might focus on things like ICOs (providing information like the team, the investors and the number of tokens in circulation), or online publishers (to help advertisers avoid bots), or professional listings and membership lists.

There will be a single token that works across the Dirt platform. Users will need to stake tokens to add new information to databases, to challenge
