

View and control the processes running on your system

Administrators often need to see and control all the processes running on the system.

The system monitor tool can be used for this, as follows:

```
$ gnome-system-monitor
```

Executing the above command will open up a system monitor tool. There are three separate tabs called *Processes*, *Resources* and *Filesystem*.

In the *Processes* tab, you can see all the processes and kill or stop any process that you want to. In the *Resources* tab, you can see how much of the CPU or memory resources are being used. In the *Filesystem* tab, you can see the usage of the file system.

How to check the last mount timestamp of a file system in Linux

Knowing the last mount timestamp helps us to troubleshoot many issues specific to the file system. The output of the following command will give the 'Last mount time' of a file system.

```
# tune2fs -l <filesystem name>
```

```
# tune2fs -l /dev/sda1 | grep -i last
```

```
Last mounted on:      /boot
Last mount time:      Mon Aug 13 23:12:00 2018
Last write time:      Mon Aug 13 23:12:00 2018
Last checked:         Sat Feb 18 11:32:04 2017
```

Minimising a running window in Ubuntu 18.04

Wouldn't it be nice to be able to minimise an open window in Ubuntu 18.04 by just clicking on the icon on the taskbar, like we do on other OSs like MS Windows? Though this facility doesn't come by default, when we install a fresh Ubuntu OS, we can get that feature by running a single command on the terminal.

Step 1: Open your terminal using *Ctrl+Alt+T* or through the dashboard.

Step 2: Run the following command on the terminal:

```
$ gsettings set org.gnome.shell.extensions.dash-to-dock
click-action 'minimize'
```

And you're done. Hope you like this.

Trace your third party rpm commands

Most of us know *rpm* commands and the options to them. Here is a tip to find out all the installed third party packages. The following commands help you to find out what external packages are on the system.

```
[root@blrvvmXXvmXX ~]# rpm -qa --qf '%{NAME} %{VENDOR}
%{DISTRIBUTION}\n' | grep -v CentOS
mongodb-org-server (none) (none)
mongodb-org-shell (none) (none)
mongodb-org (none) (none)
uwsgi-plugin-common Fedora Project Fedora Project
libuv Fedora Project Fedora Project
uwsgi-plugin-python Fedora Project Fedora Project
```
