

DVD OF THE MONTH

Get started with learning security auditing and forensics.

Fedora Security Lab 28 (64-bit)

This is a Fedora spin which is maintained by a community of security testers and developers. It comes with the clean and fast Xfce desktop environment and a customised menu that provides all the instruments needed to follow a proper test path for security testing or to rescue a broken system. You can find the ISO image of the live edition in the *other_isos* folder on the root of the DVD.

Sugar on a Stick

Sugar on a Stick is a Fedora based operating system featuring the award-winning Sugar Learning Platform and designed to fit on an ordinary USB thumb drive. It sets aside the traditional office desktop metaphor, and presents a child-friendly graphical environment. You can find its ISO image in the *other_isos* folder on the root of the DVD.

KaOS 64-bit live

KaOS is an independent distribution focused on Qt and KDE. Its developers have chosen to use the Linux kernel as a base (though the Illumos kernel is under constant evaluation, and a future switch is a wish). After that choice, the best available package manager, as well as the most flexible way of package building and repository maintenance is pacman/makepkg. The live edition can be tried directly using the bundled DVD.

What is a live DVD?

A live CD/DVD or live disk contains a bootable operating system, the core program of any computer, which is designed to run all your programs and manage all your hardware and software.

Live CDs/DVDs have the ability to run a complete, modern OS on a computer even without secondary storage, such as a hard disk drive. The CD/DVD directly runs the OS and other applications from the DVD drive itself. Thus, a live disk allows you to try the OS before you install it, without erasing or installing anything on your current system. Such disks are used to demonstrate features or try out a release. They are also used for testing hardware functionality, before actual installation.

To run a live DVD, you need to boot your computer using the disk in the ROM drive. To know how to set a boot device in BIOS, please refer to the hardware documentation for your computer/laptop.
