an entry or to vote in disputes — they will be penalised (by losing tokens) for adding misinformation and rewarded for weeding it out. Dirt will support a variety of different governance structures, whether that's centralised moderation,

free-for-all voting or a system where votes are weighted by reputation.

The business model will probably involve some combination of giving the software away for free and charging for additional services. The company is focused on creating this open data set that anyone can use. If the firm achieves that goal, then some monetisation may happen.

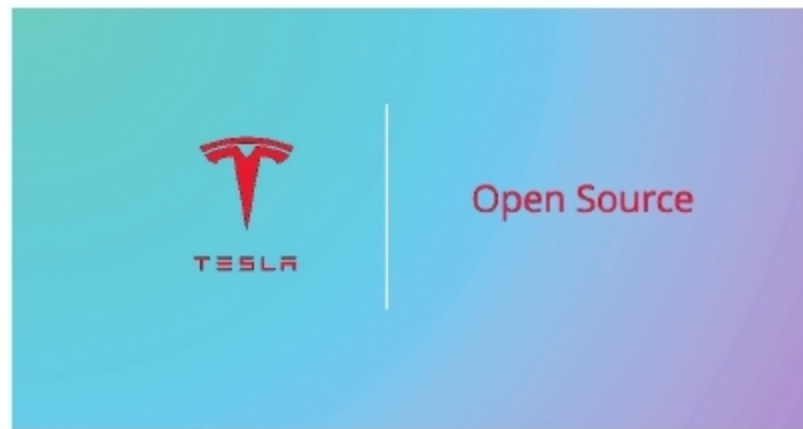

Elon Musk tweets of plans to open source Tesla's self-driving software

Elon Musk has announced that he is looking at open sourcing the code for Tesla's autonomous cars.

One of the biggest advantages of open source is that it allows independent security researchers to access the code and spot the vulnerabilities that might go unnoticed during the internal auditing.

To make things more secure, Musk has hinted at the possibility of open sourcing Tesla software code for a "safe self-driving future for all."

In an announcement on Twitter he said: "Great Q&A @defcon last night.

Thanks for helping make Tesla & SpaceX more secure! Planning to open source Tesla vehicle security software for free use by other car makers. Extremely important to a safe self-driving future for all."

The world of connected cars and self-driving vehicles is a relatively new area that's increasingly witnessing security threats.

Tesla has faced some flak for not following the open source norms. After lots of criticism, this May, Tesla announced it plans to open source some part of the code of its software that used many GPL-licensed technologies.

In the long run, this move is expected to benefit Tesla from a marketing viewpoint, as Musk can boast of a better security standard when compared to others. In the past, there have been incidents of Tesla becoming a target of hackers.

The Tesla code, once licensed to manufacturers, could turn out to be the beginning of an open standard which would drive down costs. Plus every firm that licenses the tech will be adding to locking it down securely, which is the beauty of open source.
