Important RabbitMQ terms and concepts

Table 1 lists some important terms and concepts to help us understand RabbitMQ better.

Setting up a RabbitMQ instance

Setting up a RabbitMQ instance is as easy as pie. The steps that need to be followed are listed below.

- To create a RabbitMQ instance, you need to sign up on the URL <https://customer.cloudamqp.com/instance/create>.
- Select your plan and give a proper name to your instance. In this case, I have selected a free instance, which is *Little Lemur* (Figure 3).
- Select the region where you want to deploy your instance as shown in (Figure 4).
- On confirming the details, the instance will be created with the specified name and tags (Figure 5). Once the instance is up, you can manage it and create queues using the RabbitMQ Manager (Figure 6).

You can now create an application using any programming language like Ruby, Java, Node.js, JavaScript, Python, PHP, C#, etc, and start communicating with the RabbitMQ message broker through its queues. **END** 🐧
