

KAA

Friendly and Flexible Middleware for the Internet of Things

Kaa is an open source IoT middleware applicable to enterprise IoT development at any scale. The Kaa protocol is built on top of lightweight IoT protocols like MQTT and CoAP, and defines the basic rules of communication between devices and the platform.

We have known Kaa as one of the fictional characters in Rudyard Kipling's classic, 'The Jungle Book'. But here we will talk about another role played by Kaa, with relation to different applications developed using IoT. Kaa is an open source IoT platform that is built on a modern cloud-native architecture and a customisable feature set. It is very helpful for all those who are confused while

choosing a platform prior to launching an IoT based project. Kaa is basically an IoT middleware technology that can be used for any scale of enterprise IoT development. It equips IoT based project developers with a range of unique features, which allows them to build advanced applications for various smart products.

Kaa is very flexible in managing ecosystems and for the end-to-end processing of different IoT devices. One of the major challenges experienced while working on IoT devices is the interaction or interface of different hardware devices with the software applications. Kaa can very smoothly handle such interfaces that integrate all categories of hardware applications, right from smaller to larger ones. We can develop our IoT based applications faster when using Kaa. It supports a wide range of models starting from tiny startups to massive enterprises by providing advanced deployment models for multi-cloud IoT solutions.

Different parameters that make Kaa work out-of-the-box

1. **Connectivity:** This deals with messaging between the cloud and different devices connected to the Kaa platform. That's how all devices interact with the cloud to perform different operations. The Kaa platform basically supports
