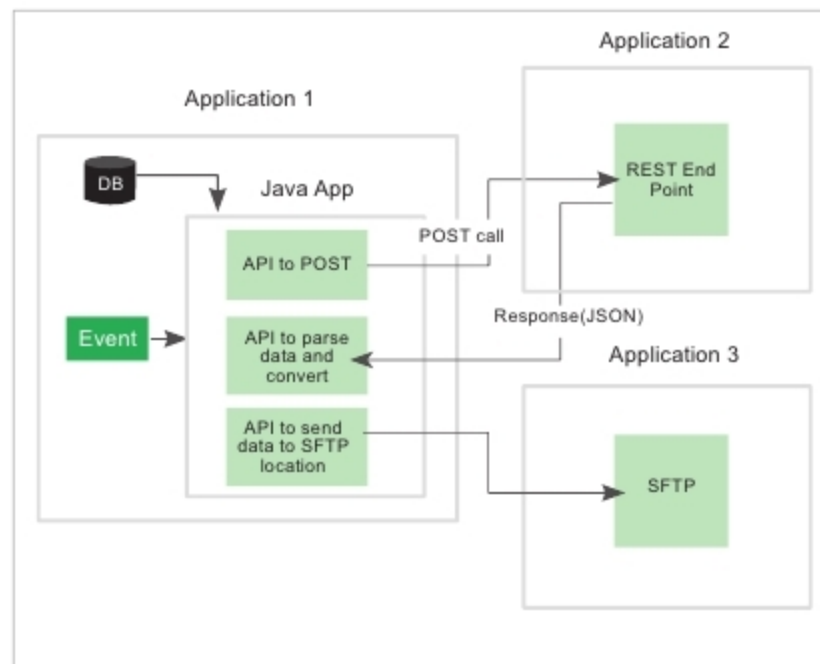

Figure 2: Complex integration

have all the bits and pieces that are ready, standard and proven. We only have to assemble them properly to complete the scene.

These bits and pieces of a jigsaw puzzle are the components, endpoints and routes in Camel.

Here is an example:

```
from("twitter://timeline/home?type=pol
ling&delay=60&consumerKey=[s]&consumer
Secret=[s]&accessToken=[s]&accessToken
Secret=[s]")
.to("file:twitter");
```

The above example shows a route with two components —Twitter and the file.

- The Twitter component has the endpoint 'timeline/home' and parameters like type, delay and more.
- The file component has the endpoint 'twitter'. Here 'twitter' is a local folder in the file system.
- In this example, the Twitter component will poll data every 60 seconds and send this to a local file system.

This simple example shows how easy it is to integrate systems with Apache Camel.

Sample examples for the file component can be found at <https://github.com/sumeetpatil/camel-samples>. More examples of Apache Camel can be found at <https://github.com/apache/camel/tree/master/examples>.

Why use Apache Camel?

Apache Camel follows enterprise integration patterns.

Writing some spaghetti code and letting the applications work together is not the standard practice. Some standards must be followed before writing any code. Enterprise integration patterns, which are standard design patterns, aim to integrate new and existing software.

- To define routes, Camel offers domain specific languages (DSL) for programming like Java DSL, Spring DSL, Scala DSL, and more. The purpose of Java DSL is to allow developers to focus on the integration problem rather than the programming language.
- Camel provides more than over 300 components and the list is growing.
- It requires minimal configuration using an easy URI configuration. Here is an example:

```
from("file:inbox/data")
```

Apache Camel is an awesome integration framework which is widely used by most companies. In an era when technology is moving at a really fast pace, integration plays a vital role and we cannot think of a better framework than Apache Camel for this. **END** 🐧
